WHAT IS CLAIMED IS:

5

10

20

1. An energization processing apparatus for performing, in a reduced-pressure atmosphere, an energization process on electric conductors which are placed on a substrate, comprising:

•a vessel which has an exhaust hole and which covers the electric conductors and one region on a surface of the substrate where the electric conductors are placed, to thereby create an airtight atmosphere between the substrate and the vessel;

a first temperature adjusting mechanism for adjusting a temperature of the one region of the substrate; and

a second temperature adjusting mechanism for adjusting a temperature of the other region of the substrate.

2. An electron source manufacturing apparatus for energizing, in a reduced-pressure atmosphere, electric conductors which are placed on a substrate to form electron-emitting regions in the electric conductors, comprising:

a vessel which has an exhaust hole and which covers the electric conductors and one region on a surface of the substrate where the electric conductors are placed, to thereby create an airtight atmosphere between the substrate and the vessel;

a first temperature adjusting mechanism for adjusting a temperature of the one region of the substrate; and

a second temperature adjusting mechanism for adjusting a temperature of the other region of the substrate.

3. An energization processing method for performing, in a reduced-pressure atmosphere, an energization process on electric conductors which are placed on a substrate, comprising the steps of:

covering the electric conductors and one region on a surface of the substrate where the electric conductors are placed with a vessel which has an exhaust hole, to thereby create an airtight atmosphere between the substrate and the vessel;

reducing a pressure of the airtight atmosphere; and

heating the other region of the substrate at a temperature higher than the temperature of the one region and energizing the electric conductors.

4. An electron source manufacturing method for energizing, in a reduced-pressure atmosphere, electric conductors which are placed on a substrate to form electron-emitting regions in the electric conductors, comprising the steps of:

covering the electric conductors and one region on a surface of the substrate where the electric conductors are placed with a vessel which has an exhaust hole, to thereby create an airtight atmosphere between the substrate and the vessel; reducing a pressure of the airtight atmosphere; and

heating the other region of the substrate at a temperature higher than the temperature of the one region and energizing the electric conductors.
